

This is a virtual organization with 75 employees who are all based in Seattle. They are all connected virtually and meet virtually as needed during the week. They share a database. This allows their vendors to see what they need and when, the finance department can approve purchasing from vendors based on the marketing and sales departments requests, and the production department can keep track of new products developed by the software engineers and specifications, while the customer service department provides information concerning each customer purchase and satisfaction, and handles any distribution complaints. As each product travels through the system, everyone in the company can see where it is at any one time.
